

Illustrated Notes

Diagrams carry information that prose alone cannot, but a figure on its own is rarely enough. Each illustration in these notes is wrapped in enough surrounding text to explain what the reader is meant to take from it, so the import pipeline has both a real text layer to anchor to and a figure to crop and place inline beside that text.

Figure 1. A schematic block diagram.

The block diagram above shows how three components pass data from one stage to the next. Notice that the arrangement is strictly left to right: nothing in the diagram feeds backwards. The waveform plotted below, by contrast, is periodic, and its shape repeats at a fixed interval that can be measured directly off the page.

Figure 2. A plotted periodic waveform.

A larger illustration can occupy most of a page when the detail genuinely matters. The figure below overlaps two fields so that the region where they interact is visible at a glance. When a figure is this large, the caption and the paragraph that introduces it do most of the work of telling the reader where to look first.

Figure 3. Two overlapping fields, drawn to scale.

Taken together, the three figures move from the abstract to the concrete. The first is a structural sketch, the second is a measurement, and the third is a spatial map. Study notes that mix figures and prose like this are exactly the case the structured importer is built to handle well.
